

RF Exposure evaluation

Product Description: Low Profile Bluetooth FM Transmitter

Model Number: VM-201

FCC ID: 2ALU4VM-201

According to 447498 D01 General RF Exposure Guidance v05 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances ≤ 50 mm are determined by: [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] $\cdot \sqrt{f(\text{GHz})} \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

$f(\text{GHz})$ is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation

According to the follow transmitter output power (P_t) formula:

$$P_t = (E \times d)^2 / (30 \times g_t)$$

P_t =transmitter output power in watts

g_t =numeric gain of the transmitting antenna (unitless)

E =electric field strength in V/m

d =measurement distance in meters (m)

According to the above test data,

$$P_t = -1.681 \text{ dBm} = 0.68 \text{ mW}$$

The result is rounded to one decimal place for comparison

Worse case is as below: [2441MHz -0.68mW output power]

$$(0.68 \text{ mW} / 5 \text{ mm}) \cdot \sqrt{2.441 (\text{GHz})} = 0.21 < 3.0 \text{ for 1-g SAR}$$

Then SAR evaluation is not required

NOTE: For the maximum power, you can refer FCC test report.
